

Here's a clear description of the process flow:

1. **Start:** The process begins with "Receive Order" (triggered from n10).
2. **First Split:** After receiving the order, two things happen *exclusively* (only one path can be taken):
3. *Either* the process immediately ends through a silent transition (n12 → n6)
4. *Or* you "Inform Storehouse and Engineering Department" (n16)
5. **Main Process Path** (if you choose to continue):
6. *Simultaneously:*
  - **Path A (Storehouse):**  
A silent transition (n13) → "Select Unchecked Part" (n21) → "Check Part Quality" (n20)
  - *Exclusive choice after checking quality:*
    - "Back-order Part" (n18) *or* "Reserve Part" (n19)
  - After either back-order/reserve:
    - *Loop option:* Return to "Select Unchecked Part" (n21) through n8
    - *Or* proceed via silent transition (n14) to join assembling
  - **Path B (Engineering):**  
"Prepare for Assembling" (n23) → Wait at n11
7. **Convergence:** When both paths are ready:
8. "Assemble Bicycle" (n17) starts *only after* receiving:
  - Parts approval (from silent transition n14 → n3) *AND*
  - Preparation confirmation (from n11)
9. **Final Step:**  
"Ship Bicycle to Customer" (n15) ends the process at n6.

**Key Relationships:**

- The part quality check loop (steps 3A) can repeat until parts are approved
- Storehouse (3A) and Engineering (3B) work *in parallel* but must synchronize before assembly
- All silent transitions (n12, n13, n14) act as behind-the-scenes handoffs between steps
